

# Creating a Game Rental Network Database

Jack Lindner and Kaylee Moore

# Understanding of this project

---

This project is designed to teach students how to create a database management system from scratch. Starting with a problem and then creating a full solution to address the problem.

# Goal of this project

---

The goal of this project is to provide a system that manages the inventory and rental of video games in a rental store network.

There are many stores in this network, each in a different region carrying different stock and having different employees.

# Technical problems and issues

---

Separating staff from managers permissions - login specific to managers will have administrative permissions, but staff logins will not.

# Overview of solution

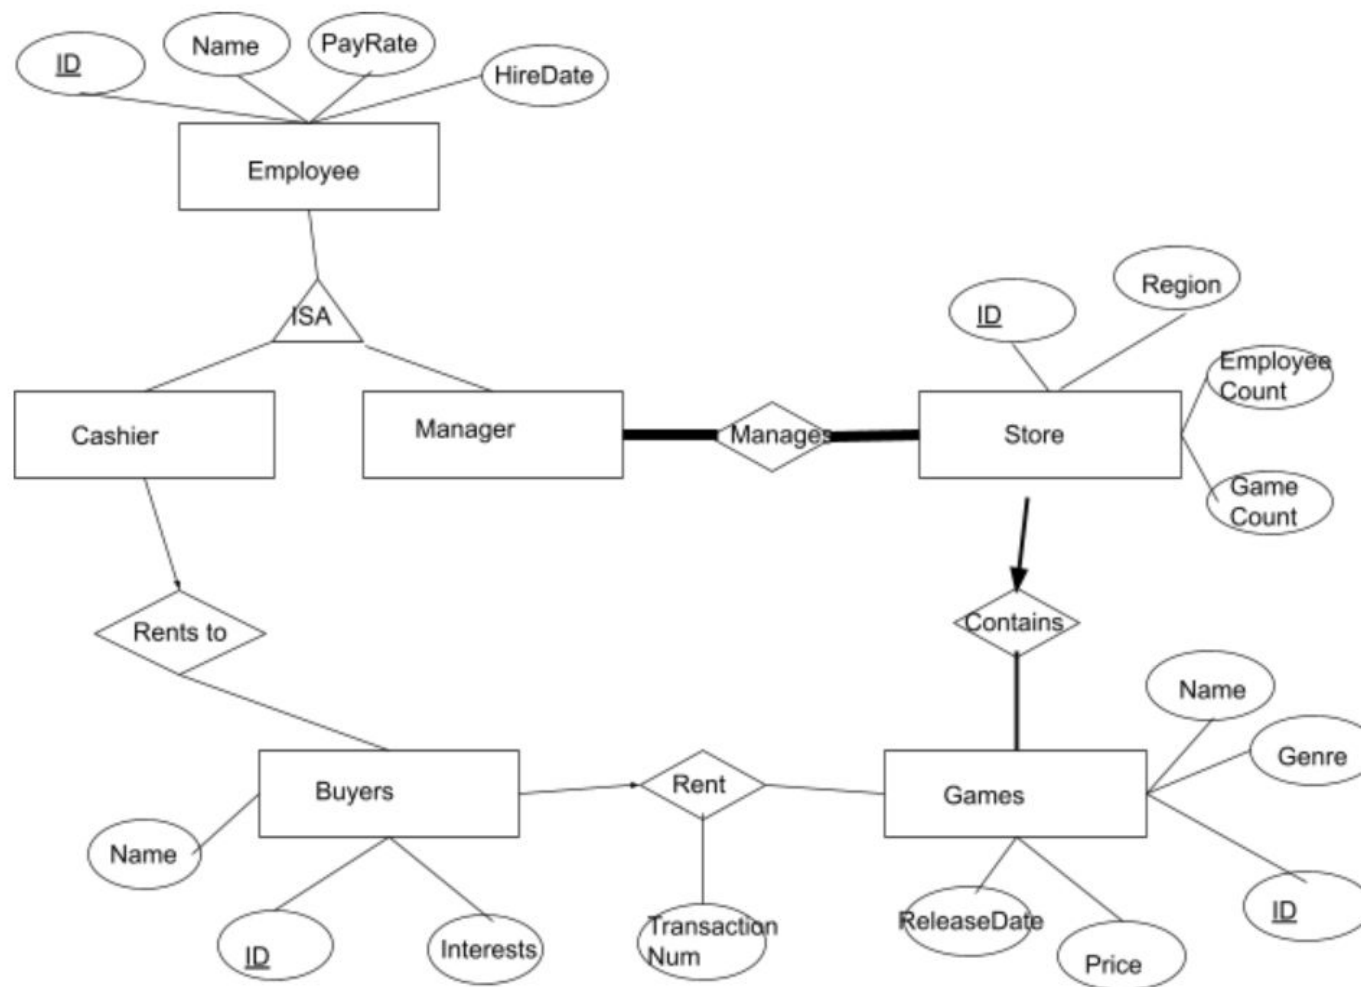

---

1. Buyers rent games.
2. Buyers have names, ids, and interests.
3. Games have names, genre, ids, release dates, price, and rental length.
4. Cashiers rent games to buyers.
5. Cashiers have names, ids, hire date, and pay rate.
6. Cashiers can be managers or employees.
7. Buyers can rent from a network of stores.
8. Stores have regions, ids, staff count, game count, and manager.
9. Each store must have at least one manager and only managers can see pay rates and edit/add games.
10. Employees can rent games and view information about them, but not edit.

# Requirements

---

1. Buyer registers with store in their region with name, and their interests.
2. Buyer can view name, genre, id, release date, price, and rental date of games they're interested in
3. Buyer can search for games within the store to see if it is available
4. Everyone can sort and view games list by qualifiers (genre, release date, price)
5. Cashier or manager can check out the buyer if they have at least one game.
6. Buyer can ask for the cashier's name but not their id, hire date, or pay rate.
7. Everyone can see if a game is rented out (available)
8. Cashiers and managers can view all store information like region, id, staff count, game count, and manager.
9. Buyer can view store region and game count only.
10. Managers can edit inventory
11. Cashiers can view all game information but not edit the information

# Redundancies and Method:

---

We broke up all the items and processes as we built the schema in the first place.

Instead of making everything attributes, we built everything to be self-contained. Therefore, when making the tables, there isn't very much overlap or redundancies between the tables.

Only one table contains a 'log' of information that has to be saved, and so is the only one that can contain redundancies by nature.

# Employee Table

---

Employee(int eID, String name, int payRate, date hireDate)

```
CREATE TABLE Employee(INTEGER eID, VARCHAR(255) name, INTEGER  
payRate, TIMESTAMP hireDate, PRIMARY KEY(eID))
```

# Rent Table

Rent (int transactionNum, int eID, int bID, int gID)

```
CREATE TABLE Rent (INTEGER eID, INTEGER bID, PRIMARY  
KEY(transactionNum), FOREIGN KEY(eID, bID, gID))
```

transactionNum -> eID, bID

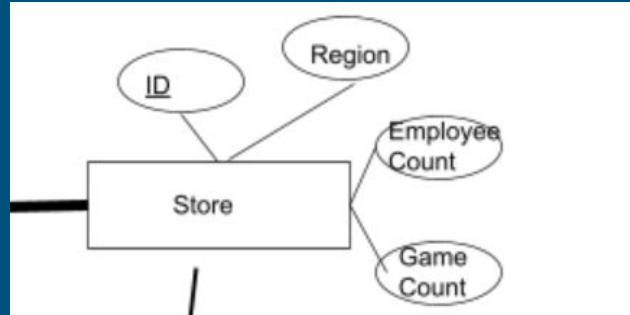

# Manager Table

Manager (int eID, int sID)

```
CREATE TABLE Manager(INTEGER eID, INTEGER sID, PRIMARY KEY(eID, sID),  
FOREIGN KEY(eID, sID))
```

# Store Table

Store(int sID, String region, int employeeCount, int gameCount)

```
CREATE TABLE Store (INTEGER sID, VARCHAR(255) region, INTEGER  
    employeeCount, INTEGER gameCount, PRIMARY KEY(sID))
```

# Buyers Table

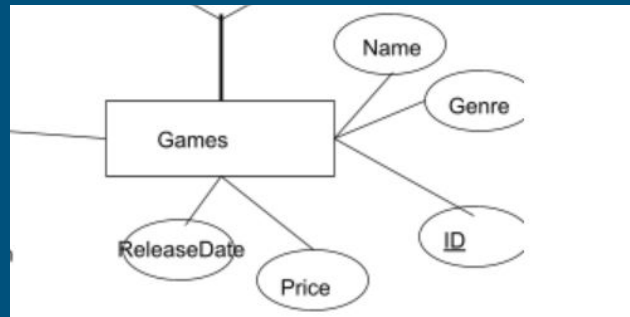

---

Buyers(int bID, String name, String interests)

```
CREATE TABLE Buyers(INTEGER bID, VARCHAR(255) name, VARCHAR(255)  
interests, PRIMARY KEY(bID))
```

# Games Table

Games(int gID, String name, String genre, date releaseDate, double Price)

```
CREATE TABLE Games(INTEGER gID, VARCHAR(255) name, VARCHAR(255)
genre, TIMESTAMP releaseDate, DOUBLE Price, INTEGER sID, PRIMARY
KEY(gID), FOREIGN KEY (sID))
```
